

1           **REDUCING EFFECTS OF ROTATIONAL VIBRATION IN DISK DRIVE**

2  
3                           **ABSTRACT**

4  
5           A method of reducing rotational vibration effects in a disk drive by sensing  
6 vibration in a sensor and generating corresponding sensor data; deriving a statistical  
7 sensor (SS) value based on the sensor data; deriving a statistical position error signal  
8 (SPES) value from servo sectors read by the head; comparing the SS value to a SS-  
9 threshold value; comparing SPES value to a SPES-threshold value; and generating a  
10 feed-forward command effort signal for reducing rotational vibration effects if the SS  
11 value exceeds the SS-threshold value and if SPES value exceeds the SPES-threshold  
12 value.
